## ALIGNMENTS

```
The sequences (AAR43694-98) are subsequences from GT, they provoke T- and B-cell responses in mammals. The can be used to produce a vaccine comprising 2 of these sequences attached to a peptidyl core matrix. They are useful in producing T-cell responses to the GT enzyme causing a reduction of colonisation or accumulation of mutans steptococcal strains in mammals. The vaccines can be used in preventing dental caries. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                    GT; glucosyltransferase; vaccine; T-cell; B-cell; reaction; immunoresponse; peptidyl core matrix; dental caries; diptheria; tetanus;
                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic glucosyl-transferase peptide(s) - provoke T- and B-cell reactions in mammals, and are effective against dental caries.
                                                                                                                                                                                                                                                                                                                                                       (FORS-) FORSYTH DENTAL INFIRMARY FOR CHILDREN

              AAY43338
                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  glucosyltransferase in a mammal. The immune response results in reduction of the colonisation or accumulation of mutans streptococcal strains in the mammal. Compositions containing AAW34156 specifically interfere with the glucan-binding activity of the streptococcal glucosyltransferase. The peptides can also be used in vaccines for preventing dental caries in mammals. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAW34156-W34160 represent immunogenic fragments of the Streptomyces mutans glucosyltransferase (GTF) enzyme. AAW34157 and AAW34158 are from the catalytic domain of GTF, while AAW34160 is from the GTF surface domain. AAW34156 and AAW34159 are from the glucan-binding domain of GTF. These sequences can all be used in the immunogenic composition of the invention. The composition of the invention can alternatively comprise one or more of these sequences linked to a lysine core matrix (see AAW34161-W34165). A composition comprising one of these sequences can be administered to a mammal to raise an immune response, in a method for interfering with the enzymatic activity of streptococcal.
                                                                                                                                                                                                                                                           Glucosyltransferase; GTF; enzyme; immunogen; catalytic domain; vaccine; surface domain; glucan-binding domain; mutans streptococcal strain; immune response; glucan-binding activity; dental caries prevention.

This sequence represents a glucosyltransferase (GTF) immunogenic epitope, and can be used in the immunogenic composition of the invention. The immunogenic composition (A) comprises at least one streptococcal glucan (SG) and at least one component (I) covalently coupled, (in)directly, to SG. (A) elicits antibodies (Ab) to both SG and (I). (A), and related compositions, are used to induce an antibody response to cariogenic compositions, are used to induce an antibody response to cariogenic CS bacteria, collectively called "mutans streptococci" (i.e. any of Streptococcus mutans, S. rattus, S. cricetus or S. sobrinus), especially compressive in humans or other animals. The composition can cherefore be used for the treatment or prevention of caries (particularly dental caries). Abs raised against (A) can be used: (a) to detect SG, and (b) for passive immunisation, e.g. applied directly to the surface of the tet. SG is a poorly immunogenic type 2 T-call independent antigen but when coupled to (I) it produces a conjugate which induces significant immunity to both components, resulting in immunological memory and longical lasting antibody production against SG, in adults and children
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                  Immunogenic compositions for control of dental caries, based on
Streptococcus mutans components, particularly for vaccination of infants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

1.22 (The state of the state of the state of the state of the state of the dendritic polylysine core via the alpha-amino group of Lys(23); a second copy of the antigenic 22-mer is linked to Lys(23) via the omega amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "the alpha amino acid group of Lys(24) forms a peptide linkage with the carboxyl amino group of Lys(23);
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB-derived peptide of the invention.
                                                                                                                                                                                                                                                                                                                        (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Glucosyltransferase; GTF; enzyme; immunogen; catalytic domain; vaccine; surface domain; glucan-binding domain; mutans streptococcal strain; immune response; glucan-binding activity; dental caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "Lys(23) is linked to one copy of the antigenic peptide through the alpha-amino group, and to a second copy of the peptide (not shown) via the omega amino group"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of a glucan-binding peptide comprising amino acid residues 1303-1324 of Streptococcus sobrinus glucosyltransferase. The peptide can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class II protein-binding peptide from Streptococcus mutants glucan binding protein-binding peptide from Streptococcus mutants glucan binding protein- of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multipeliopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GDBB can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.

The present invention describes the purification of a protein comprising mixing an adsorbent containing a crosslinking dextran with a solution containing a tueed protein. The protein molecule to be purified is fused with a dextran-combining domain of a sequence of 236 amino acids (see ABP56632, S1), or a dextran-combining domain having an amino acid sequence wherein at least one amino acid is deleted, replaced or added in (S1), and has dextran-combining activity. The adsorbent taken out of solution is then mixed with a solution containing dextran and the fused protein is eluted in the solution containing dextran. The method is used for the purification of a protein
                                                                                      Purification of a protein useful in pharmacology and medical science, comprises eluting the protein in a solution containing dextran.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                        AAW34161-W34165 represent the Streptomyces mutans glycosyltransferase (GTP) enzyme immunogenic fragments shown in AAW34186-W34460 linked to a polylysine core. AAW34157 and AAW34158 are from the catalytic domain of GTF, while AAW34160 is from the GTF surface domain. AAW34156 and AAW34159 are from the glucan-binding domain of GTF. These sequences, and the immunogenic fragments shown in AAW34156-W34160 can all be used in the immunogenic composition of the invention. A composition comprising one of these sequences can be administered to a mammal to raise an immune streptococcal glucosyltransferase in a mammal. The immune response results in reduction of the colonisation or accumulation of mutans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      streptococcal strains in the mammal. Compositions containing AAW34156 specifically interfere with the glucan-binding activity of the terptococcal glucosyltransferase. The peptides can also be used in vaccines for preventing dental caries in mammals. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                     Immunogenic compositions containing streptococcal glucosyl:transferase peptide(s) - used for provoking immune response to streptococcal glucosyl:transferase for preventing dental caries.
the omega amino group of Lys(24) forms a peptide bond with a second Lys residue analogous to Lys(23)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cariogenetic streptococci; dextran-combining domain; purification

Streptococcus sobrinus, and a glucan-binding region of glucan synthetase. Also described is a recombinant DNA encoding the fusion protein of the invention, an expression vector containing the recombinant DNA, a transformed host containing the expression vector, and an antibody formulation containing the antibody with respect to the fusion protein. The fusion protein and the antibody formulation of the invention are useful for preventing dental caries caused by S. sobrinus. The fusion protein allows the inhibition of adheaion of microorganisms such as S. sobrinus on the surface of teeth, and induces phagocytosis of microbial cells, and thus prevents dental caries in an individual. This sequence represents a protein relating to the present invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the protein sequence of Streptococcus sobrinus glucosyltransferase-I (GTF-I). Peptide fragments of GTF-I, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions binding peptide from S. mutants glucan binding protein-B (GppB) covalently linked with a speptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multiepitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus sobrinus GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 volue, that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New composition comprising a fragment of a glucan binding protein-B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      560. .571
/label= SEQ_ID_9
/note= "This sequence is specifically claimed in Claim 7"
                                                                                                                                                                                                  Novel modified dextran sucrase which exchanges one site of active center zone of dextran sucrase for active center zone of different types of dextran sucrase, useful for manufacturing glucan.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (for example dexiran) which uses D-glucoses, such as a starch and a cellulose, as a structural unit. The modified enzyme of the invention is useful in the manufacture of glucan. The selection of the active centre area of DS which carries out transduction, enables changes in structure and character of an enzyme-reaction product and their application to various uses. The present sequence is that of a protein which is related to the Leuconostoc mesenteroides dextran sucrase protein and which was used during the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dextran saccharase, enzyme; cytostatic; dermatological; antiseborrheic; DSR-E; glycosyl transferase; dextran; prebiotic; pharmaceutical; microflora regulation; intestinal transit; mineral assimilation; colon cancer; acne; dandruff; body odour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match 81.4%; Score 92; DB 7; Length 1499; Best Local Similarity 77.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The DNA sequence from Streptococcus sobrinus strain 6715 encodes glucosyltransferase-1 (and mutanis). The DNA was obtd. by treating S. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with Sau3Al and fractionating on agarose gel. The 3-5 kbp digesting with sau3Al and fractionating on agarose gel. The 3-5 kbp digesting was lighted into pUC18 and E. coli JM109 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for deneal caries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA sequence glucosyl:transferase-I - comprises Streptococcus sobrinus DNA sequence with at least one nucleotide added or deleted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             dextran sucrase; active centre zone; glucan; polysaccharide; dextran;

The present sequence is a novel dextran saccharase, DSR-E, from Leuconostoc mesenteroides NRRL B-1299. The saccharase has glycosyl transferase activity suitable for producing dextrans having alpha(1-2) branches from sucrose, p-nitrophenyl-alpha-D-glucopyranoside, alpha-fluoroglucose, alpha-D-glucopyranoside-alpha-D-sorbopyranoside or alpha-D-glactopyranosyl-sucrose. The dextran saccharase is useful in prebiotic, pharmaceutical or cosmetic compositions. The dextrans and related compounds having alpha(1-2) bonds, produced using DSR-E, may be involved in signalling/cellular recognition processes in vivo (specifically in perequation of microflora in the intestinas or on the skin); and are potentially useful for improving intestinal transit, increasing assimilation of minerals (e.g. calcium and/or magnesium), preventing cancer of the colon and combating skin problems such as acne, dandruff and body odour. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New glycosyl transferase enzymes, containing glucan bonding and catalytic domains and producing alpha-(1-2) branched dextrans, useful in probiotic, pharmaceutical or cosmetic compositions.
                                                                                                                                                                                                                                                                                                                                                                  is specifically claimed in Claim 7"

The present sequence represents a glycosyltransferase, designated DSR-D. This enzyme produces dexrrans having alpha(1-2) branches from sucrose, alpha-D-fluoroglucose, p-nitrophenol alpha-D-glucopyranoside, alpha-D-galactopyranoside-alpha-D-sorbofuranoside or 4-0-alpha-D-sorbofuranoside or 4-0-alpha-D-spare oligosaccharides and oligosides for prebiotic, pharmaceutical, diagnostic and cosmetic applications, e.g. to improve health and weight gain in animals; prevent cancer of the colon; and treat skin disorders such as acne, dandruff and body odour. The oligosaccharides and oligosides produced by DSR-D improve intestinal transit and assimilation of calcium,
                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptide with glycosyltransferase activity, useful for producing dextrans with alpha 1-2 branches, e.g. used as prebiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by Streptococcus mutans, particularly mouse-hybridoma MHP126 (FERM P-17566) or mouse-hybridoma MHP136 (FERM P-17567), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl transferase-B and is used in the immunotherapy of dental caries. This sequence represents a Streptococcus mutans monoclonal antibody-related
                                                                                                                                                                                                                                                                                                                           Anti-caries agent composed of a monoclonal antibody against an inhibitory enzyme against water insoluble glucan synthetase of glucosyl transferase-B (GTF-B) of Streptococcus mutans.
Antibody, dental caries, water insoluble glucan synthetase, anti-caries, glucosyl transferase-B; immunotherapy.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: Analysis of the Streptococcus downei gtfS gene, which specifies a glucosyltrans A;Reference number: A41483; MUID:90316665; PMID:2142479 A;Accession: A41483 A;MID:90316665; PMID:2142479 A;Molocule type: DNA A;Residues: 1-1365 cGIL>A;Coss-references: UNIPARC:UPI000012BCB6; GB:M30943; NID:g153652; PIDN:AAA26898.1; PID:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C.Function:
A.Description: catalyzes the synthesis of both water-soluble and water-insoluble glucans
C.Keywords: duplication; glycosyltransferase; hexosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

chitinase (EC 3.2.1.14) B - Clostridium paraputrificum
N.Alternate names: 1,4-beta-poly-N-acetylglucosaminidase; chitodextrinase
C;Species: Clostridium paraputrificum
C;Species: Clostridium paraputrificum
C;Apete: 23.Apr-1999 #sequence_revision 23.Apr-1999 #text_change 09-Jul-2004
C;Accession: T00323
R;Ohmiya, K.; Sakka, K.; Kimura, T.; Karita, S.; Morimoto, K.
J. Bacteriol: 179, 7306-7314, 1997
A;Tile: Cloning, sequencing, and expression of the gene encoding Clostridium paraputrifi
A;Reference number: Z14138; MuID:98053843; PMID:9395694
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A;Status: translated from GB/EMBL/DDBJ

J. Bacteriol. 163-1271-4278 (1987).

L. FUNCTION: Production of extracellular glucans, that are thought to play a key role in the development of the dental plaque because of their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.

CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl) (n) = D-fructose + (1,6-alpha-D-glucosyl) (n+1).

CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl) (n) = D-fructose + (1,6-alpha-D-glucosyl) (n+1).

MISCELLANBOUS: GTF-I synthesizes water-insoluble glucans (alpha 1,3-linked glucans (alpha 1,6-glucose). GTF-SI synthesizes water-soluble glucans (alpha 1,6-glucose). GTF-SI synthesizes corns of glucans.

C.: SIMILARITY: Belongs to the glycosyl hydrolase 70 family.

C.: SIMILARITY: Contains 19 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This Swiss-Prot entry is copyright. -!- SIMILARITY: Belongs to the glycosyl hydrolase 70 family.
-!- SIMILARITY: Contains 16 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 1592;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Catalytic (approximate).
7 X tandem repeats.
Glucan-binding (approximate)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 110; DB 1; Length 15

-!- FUNCTION: Production of extracellular glucans, that are thought to play a key role in the development of the dental plaque because of their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.

-!- CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl)(n) = D-fructose + (1,6-alpha-D-glucosyl)(n+1).

-!- SUBCELLULAR LOCATION: Secreted.
-!- MISCELLANEOUS: GTF-I synthesizes water-insoluble glucans (alpha 1,3-linked glucose and some 1,6 linkages), GTF-S synthesizes water-soluble glucans (alpha 1,6-glucose). GTF-SI synthesizes both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PINE, B33135, B33135.

SIMILARITY: Belongs to the glycosyl hydrolase 70 family.
SIMILARITY: Contains 10 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Glucosyltransferase-I.
A repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL, AE014940, AANS8705.1; -; Genomīc_DNA.

Natl. Acad. Sci. U.S.A. 99:14434-14419 (2002).

- i. FUNCTION: Production of extracellular glucans, that are thought play a key role in the development of the dental plaque because their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.

- i. CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl) (n) = D-fructose + (1,6-alpha-D-glucosyl) (n+1).

- i. SUBCELLULAR LOCATION: Secreted.

                                                                                                                            This Swiss-Prot entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use as long as its content is in no way modified and this statement is not
                 1,3-linked glucose and some 1,6 linkages), GTF-S synthesizes water-soluble glucans (alpha 1,6-glucose). GTF-SI synthesizes both forms of glucans. Signatures to the glycosyl hydrolase 70 family. SIMILARITY: Belongs to the glycosyl hydrolase 70 family. SIMILARITY: Contains 6 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A -> V (in strain MT4245).

Glucasyltransferase that synthesizes soluble glucans.";

Infect. Immun. 58:2452-2458(1990).

-!- FUNCTION: Production of extracellular glucans, that are thought to play a key role in the development of the dental plaque because of their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.
                                                                                                                                                                                                                                                                                                                                                                                                                                         STRAIN=NRRL B1299; MEDL/NBL B1299; MEDL/NBL-97136686; PubMed=8982063; DOI=10.1016/S0378-1119(96)00443-X; Monchois V., Willemot R.M., Remand-Simeon M., Croux C., Monsan P.; Cloning and sequencing of a gene coding for a novel dextransucrase from Leuconostoc mesenteroides NRRL B-1299 synthesizing only alpha (1-6) and alpha (1-3) linkages.";

CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl)(n) = D-fructose + (1,6-alpha-D-glucosyl)(n+1).

ENZYME REGULATION: Glucoan synthesis by GTF-S is independent of primer glucan unlike GTF-I.

MISCELLANBOUS: Synthesizes water-soluble glucans (alpha 1,6-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                         family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   69.0%; Score 78; DB 1; Length 1365; 68.2%; Pred. Patent No. 6087559;
GENERAL INFORMATION:
APPLICANT: Nichols, Scott E.
TITLE OF INVENTION: Substitutes for Modified Starch and
TITLE OF INVENTION: Latexes in Paper Manufacture
TILE REFERENCE: 0356D
CURRENT APPLICATION NUMBER: US/09/007,999
CURRENT APPLICATION NUMBER: 1998-01-16
EARLIER APPLICATION NUMBER: 08/478,704
EARLIER FILING DATE: 1995-06-07
NUMBER OF SEQ ID NOS: 2
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3; Indels
